

Zenler FAQ Content Analytics Report

Comprehensive analysis of the merged FAQ bank

677 FAQs | 20 categories | Source edition: merged and refined master

Prepared from the uploaded Zenler FAQ master. This report measures the content inside the document; it does not claim external Google search volume, customer-ticket volume, or platform usage frequency.

Executive summary

- The master contains 677 FAQs across 20 categories. The average category contains 33.9 FAQs, but coverage is uneven: the largest category contains 185 and the smallest 12.
- Instructional demand dominates: 230 questions (34.0%) begin with “How”, while capability questions beginning with “Can” account for 197 (29.1%).
- The content is rich but not uniformly publication-ready. 258 FAQs (38.1%) triggered none of the editorial risk heuristics used in this audit; 327 contain placeholder/transcript-style wording and should be rewritten before website publication.
- 81 FAQs (12.0%) contain embedded web or video source references. These are valuable for traceability, but should be moved to internal source notes or footnotes rather than left inside customer-facing answers.
- The largest opportunity is to separate the bank into three layers: a concise public FAQ library, detailed support articles for procedural questions, and an internal evidence/source register for verification and maintenance.

Key indicators

Total FAQs	Categories	Avg. answer length	Publication-ready*	Placeholder/ transcript
677	20	63 words	258 (38%)	327 (48%)

*“Publication-ready” here means no heuristic flag was triggered. It is not a substitute for factual review or official product verification.

1. Scope and methodology

The analysis treats each numbered question followed by its answer as one FAQ record and uses Heading 1 text as the category label. It calculates descriptive counts and applies transparent text-based heuristics to identify question intent, support need, source coverage, answer length and editorial risk.

What this report can and cannot show

It can show what appears most often inside the compiled material, which topics dominate the bank, and where the content needs editorial work. It cannot show real-world search demand, customer prevalence, product adoption or support deflection without external datasets such as Google Search Console, keyword tools, site analytics, support tickets or chatbot logs.

2. Coverage by category

Figure 1. Number of FAQs in each of the 20 master categories.

Category distribution

Rank	Category	FAQs	Share
1	Online Courses	185	27.3%
2	Powerful Site Builder	69	10.2%
3	Payments	48	7.1%
4	Marketing Funnels	37	5.5%
5	Blog	35	5.2%
6	Community	35	5.2%
7	Broadcasts	28	4.1%
8	Live Classes	26	3.8%
9	Live Webinars	26	3.8%
10	Digital Downloads	23	3.4%
11	Memberships	22	3.2%
12	Automations	22	3.2%
13	1-1 Booking/Coaching	19	2.8%
14	Live Streaming	16	2.4%
15	Custom Domain	16	2.4%

16	Quizzes & Surveys	16	2.4%
17	Live Chat	15	2.2%
18	Analytics	14	2.1%
19	Branded Mobile App	13	1.9%
20	Multiple Sites	12	1.8%

Interpretation: high-volume categories reflect the amount of material collected, not necessarily the true prevalence of customer demand. Categories with few FAQs may represent either lower demand or incomplete capture.

3. Search-style question intent

Figure 2. Questions grouped by their opening search phrase.

“How” questions are the largest group, indicating that the bank is primarily procedural. “Can” questions represent feature and capability validation, while “Why” questions are especially useful for troubleshooting content and AI-support retrieval. Together, How and Can account for 63.1% of the bank.

4. Support need and user journey

Figure 3. Heuristic classification of the primary support need expressed by each question.

Setup and configuration questions are strong candidates for step-by-step support articles, annotated screenshots and short videos. Troubleshooting questions should be prioritised for prominent help-centre placement because they arise when users are blocked. Strategy questions belong in educational content rather than technical support documentation.

5. Product themes and recurring areas of interest

Figure 4. Number of FAQs mentioning selected platform themes in either the question or answer.

Course, student, email, Live, community and video-related terms recur throughout the bank. These should form the main navigation and content clusters for a public FAQ or AI knowledge base. Cross-category references also show that users experience Zenler as an integrated workflow rather than as isolated product features.

6. Answer length and content format

Figure 5. Distribution of answer length in words.

The median answer length is 67 words and the mean is 63.2. The difference between the two indicates a long tail of transcript-derived answers. For public FAQ pages, a practical target is usually one direct opening sentence followed by a short explanation; longer procedures should link to a dedicated support article.

7. Editorial readiness and governance

Figure 6. Editorial indicators identified by transparent text heuristics. Categories overlap.

Primary editorial risks

Indicator	Count	Share	Recommended treatment
Placeholder or transcript wording	327	48.3%	Answers containing a generic lead-in or raw spoken material can be ambiguous, incomplete or difficult for AI systems to retrieve accurately.
Embedded source links	81	12.0%	Source URLs improve traceability but reduce readability when placed inside the public answer. Keep them in an internal evidence register or footnotes.
Time-sensitive statements	30	4.4%	Plan limits, prices, feature availability, schedules and “currently” statements require a review date and owner.
Long answers	1	0.1%	Long answers often combine multiple intents. Split them into focused FAQs or convert them into support

			articles.
--	--	--	-----------

8. Source coverage and evidence quality

81 FAQs include an explicit source URL or source marker. Many are timestamped Live Support Desk or YouTube references. This supports auditability, but source presence does not guarantee that the answer is current, complete or approved for publication.

Recommended evidence model:

- Public answer: concise, direct and free of raw URLs.
- Internal source note: official article, tutorial, video and timestamp.
- Verification status: verified, needs review, workaround, or historical.
- Review metadata: owner, last checked date and next review date.

9. Content architecture recommendations

Create a public “Top FAQs” layer: Select the 8-12 highest-value questions per category. Keep answers concise and link to detailed help articles.

Create procedural support articles: Convert multi-step and long answers into dedicated articles with screenshots, prerequisites and troubleshooting notes.

Build an AI-ready knowledge base: Use one intent per question, a direct first sentence, consistent product names, and explicit conditions or limitations.

Separate product facts from business advice: Technical capability answers should be maintained by product/support owners; marketing and strategy advice should be labelled as guidance.

Introduce content governance: Assign an owner and review frequency, especially for plan limits, integrations, pricing, Live allowances and recently changing features.

Consolidate overlapping questions: Use semantic deduplication to merge near-identical intents while retaining alternative phrasings as search aliases.

10. Priority action plan

Priority	Action	Outcome	Suggested measure
1	Rewrite placeholder/transcript answers	Removes the highest publication and AI-retrieval risk	Reduce placeholder count from 327 to 0
2	Verify time-sensitive facts	Prevents outdated pricing, limits and feature claims	100% of time-sensitive FAQs have a review date
3	Move source URLs to evidence notes	Improves public readability while preserving auditability	Public answers contain no raw source URLs
4	Split long multi-intent answers	Creates sharper search matches and easier	Review all 1 answers over 120 words

		support reuse	
5	Select top public FAQs per category	Creates a focused customer-facing knowledge layer	10 public FAQs per category, with internal links
6	Connect external demand data	Distinguishes document frequency from actual user demand	Add Search Console, support and site-search metrics

11. Recommended measurement dashboard

- FAQ views, unique users and search entrances by topic
- Internal search queries with no result or low click-through
- Support tickets associated with each FAQ topic
- Google Search Console impressions, clicks and position for FAQ pages
- AI-assistant retrieval rate and answer acceptance or escalation rate
- Content freshness: days since verification and overdue reviews
- Content effectiveness: support deflection, helpfulness votes and next-page behaviour

12. Limitations

The analysis is descriptive and source-bound. Counts reflect the compiled document rather than a representative sample of all Zenler users. Keyword mentions are based on literal text matching and may over- or under-count concepts expressed with different wording. Editorial readiness is based on transparent heuristics and should be followed by human review. No external search-volume, ticketing or behavioural data was used.

Appendix A: Statistical summary

Metric	Value	Interpretation
Total FAQs	677	Parsed numbered question-answer pairs
Categories	20	Heading 1 sections
Average FAQs per category	33.9	Coverage balance benchmark
Median question length	12 words	Typical search query length
Mean question length	11.5 words	Average wording length
Median answer length	67 words	Typical answer size
Mean answer length	63.2 words	Influenced by long transcript-derived answers
Answers with explicit source links	81	Traceability indicator
Placeholder/transcript answers	327	Highest-priority rewrite set
Time-sensitive answers	30	Require scheduled verification

Appendix B: Category counts

Category	FAQ count	Share of bank
Online Courses	185	27.33%
Powerful Site Builder	69	10.19%

Payments	48	7.09%
Marketing Funnels	37	5.47%
Blog	35	5.17%
Community	35	5.17%
Broadcasts	28	4.14%
Live Classes	26	3.84%
Live Webinars	26	3.84%
Digital Downloads	23	3.40%
Memberships	22	3.25%
Automations	22	3.25%
1-1 Booking/Coaching	19	2.81%
Live Streaming	16	2.36%
Custom Domain	16	2.36%
Quizzes & Surveys	16	2.36%
Live Chat	15	2.22%
Analytics	14	2.07%
Branded Mobile App	13	1.92%
Multiple Sites	12	1.77%
